Observations from the Well of Data: HPV Immunization in the ALERT IIS

Learning Objectives

This presentation will provide participants with knowledge related to the following HPV topics:

- Current Oregon trends in HPV uptake;
- Importance of coadministration to achieve better HPV rates;
- Pros and cons of starting HPV early or ontime;
- Initial effects of the new adult recommendations.

Summary

The ALERT IIS is a rich source of information about HPV uptake, for adolescents and for clinics. With the recent change in the adult HPV recommendation, ALERT IIS is well poised to start tracking adult HPV uptake as well. The purpose of this presentation is to give an overview of HPV immunization in Oregon from a big data perspective. Topics will include adolescent and adult rates, along with information regarding HPV timing, clinic behavior, and the importance of teen vaccine coadministration.
